4.1.1. Pandas - series creation and manipulation

03:12

Write a Python program that takes a list of numbers from the user, creates a Pandas series from it, and then calculates the mean of even and odd numbers separately using the groupby and mean() operations.

Hint: You can group the Series based on whether each number is even or odd.

Input Format:

- The user should enter a list of numbers separated by space when prompted.

Output Format:

- The program should display the mean of even and odd numbers separately.
- Each mean value should be displayed with a label indicating whether it corresponds to even or odd numbers.

Refer to the sample test cases for better understanding regarding input and output format.

```
# import pandas as pd
```

```
# # Take inputs from the user to create a list of numbers
```

```
# numbers = list(map(int, input().split()))
```

```
# grouped =
```

```
# # Display the mean of even and odd numbers with labels
```

```
# grouped.index = ['Even' if is_even else 'Odd' for is_even in grouped.index]
```

```
# print("Mean of even and odd numbers:")
# print(grouped)

import pandas as pd

# Take inputs from the user to create a list of numbers
numbers = list(map(int, input().split()))

# Create a Pandas series from the list of numbers
s = pd.Series(numbers)

# Grouping by even and odd numbers and calculating the mean
grouped = s.groupby(s % 2 == 0).mean()

# Display the mean of even and odd numbers with labels grouped.index =
['Even' if is_even else 'Odd' for is_even in grouped.index]

print("Mean of even and odd numbers:")
print(grouped)
```

4.1.2. Dictionary to dataframe

07:26

A dictionary of lists has been provided to you in the editor. Create a DataFrame from the dictionary of lists and perform the listed operations, then display the DataFrame before and after each manipulation.

Create the DataFrame:

- Convert the dictionary to a Pandas DataFrame.

Add a new row:

- Take inputs from the user for the new row data (name, age).
- Add the new row to the DataFrame.
- Display the DataFrame after adding the new row.

Modify a row:

- Modify a specific row by changing the age. Take the row index and new age value from the user.
- Display the DataFrame after modifying the row.

Delete a row:

- Take the row index to be deleted from the user.
- Remove the specified row.
- Display the DataFrame after deleting the row.

Add a new column:

- Add a column Gender with values taken from the user.
- Display the DataFrame after adding the new column.

Modify a column:

- Convert names to uppercase.
- Display the DataFrame after modifying the column.

Delete a column:

- Remove the Age column.
- Display the DataFrame after deleting the column. import pandas as pd

Provided dictionary of lists

data = {

```
'Name': ['Alice', 'Bob', 'Charlie'],  
'Age': [25, 30, 35],  
}
```

```
# Convert the dictionary to a DataFrame
```

```
df = pd.DataFrame(data)
```

```
# Display the original DataFrame
```

```
print("Original DataFrame:")
```

```
print(df)
```

```
# Adding a new row new_name =
```

```
input("New name: ") new_age =
```

```
int(input("New age: ")) df.loc[len(df)] =
```

```
[new_name, new_age]
```

```
# Display the DataFrame after adding a new row
```

```
print("After adding a row:\n",df)
```

```
# Modifying a row row_to_modify = int(input("Index
```

```
of row to modify: ")) new_age_value =
```

```
int(input("New age: ")) df.at[row_to_modify, "Age"] =
```

```
new_age_value
```

```
# Display the DataFrame after modifying a row
```

```
print("After modifying a row:") print(df)
```

```
# Deleting a row row_to_delete = int(input("Index of row to  
delete: ")) df =
```

```
df.drop(index=row_to_delete).reset_index(drop=True)
```

```
# Display the DataFrame after deleting a row
```

```
print("After deleting a row:") print(df)
```

```
# Adding a new column genders_input = input("Enter
```

```
genders separated by space: ") genders =
```

```
genders_input.split()
```

```
# Ensure correct length if
```

```
len(genders) == len(df):
```

```
df["Gender"] = genders
```

```
else:
```

```
    print("Error: Number of genders must match rows!")
```

```
df["Gender"] = ["Unknown"] * len(df)
```

```
# Display the DataFrame after adding a new column
```

```
print("After adding a new column:")
```

```
print(df)
```

```
# Modifying a column df["Name"] =
```

```
df["Name"].str.upper()
```

```
# Display the DataFrame after modifying a column  
print("After modifying a column:") print(df)
```

```

4.1.3. Student Information

01:49

Write a program to read a text file containing student information (name, age, and grade) using Pandas. Perform the following tasks:

- Display the first five rows of the data frame.
- Calculate the average age of the students (limit the average age up to 2 decimal places).
- Filter out the students who have a grade above a certain threshold (consider the threshold grade is 'B').

Note:

Refer to the displayed test cases for better understanding.

```
import pandas as pd
```

```
# Read the text file into a DataFrame file = input() data = pd.read_csv(file,
sep="\s+", header=None, names=["Name", "Age", "Grade"])

# Display the first five rows
print("First five rows:")
print(data.head())

# Calculate the average age (2 decimal places)
avg_age = round(data["Age"].mean(), 2)
print("Average age:", avg_age)

# Filter students with grade up to 'B' (A and B)
filtered = data[data["Grade"].isin(['A', 'B'])]

print("Students with a grade up to B")
print(filtered)

4.1.3. Student Information

01:49

Write a program to read a text file containing student information (name, age, and grade) using Pandas. Perform the following tasks:

- Display the first five rows of the data frame.
- Calculate the average age of the students (limit the average age up to 2 decimal places).
- Filter out the students who have a grade above a certain threshold (consider the threshold grade is 'B').

Note:

Refer to the displayed test cases for better understanding.

```
import pandas as pd
```

```

# Prompt the user for the file name
file_name = input()

# Load the data df =
pd.read_csv(file_name) # Prepare
data for calculation df['Date'] =
pd.to_datetime(df['Date']) df['Month'] =
df['Date'].dt.to_period('M') df['Sales'] =
df['Quantity'] * df['Price']

# Find the month with the highest total sales best_month
= df.groupby('Month')['Sales'].sum().idxmax()
highest_sales = df.groupby('Month')['Sales'].sum().max()

print(f"Best month: {best_month}")
print(f"Total sales: ${highest_sales:.2f}")

```

4.2.2. Best Selling Product 02:08 and

performs the following operations:

Write a Python program that takes the file name of a CSV file as input, reads the data,

- The CSV file contains the columns: Date, Product, Quantity, Price, and City.
- Find the product that sold the most in terms of quantity sold.
- Display the product that sold the most and the total quantity sold for that product.

Sample Data:

```
Date,Product,Quantity,Price,City
2025-01-01,Product A,5,20,New York
2025-01-01,Product B,3,15,Los Angeles
2025-01-02,Product A,7,20,New York
2025-01-02,Product C,4,30,Chicago
2025-01-03,Product B,2,15,Chicago
2025-01-03,Product A,8,20,Los Angeles
2025-01-04,Product C,6,30,New York
2025-01-04,Product B,5,15,Los Angeles
2025-01-05,Product A,3,20,Chicago
2025-01-05,Product C,10,30,Los Angeles
```

Note:

The data cannot be displayed in the file. You can refer to the sample data provided for insights.

```
import pandas as pd
```

```
# Prompt the user for the file name
```

```
file_name = input()
```

```
# Load the data df =
```

```
pd.read_csv(file_name)
```

```
# Find the product with the highest total quantity sold
best_product = df.groupby('Product')['Quantity'].sum().idxmax()
highest_quantity = df.groupby('Product')['Quantity'].sum().max()
# Display the result print(f"Best selling
product: {best_product}") print(f"Total quantity
sold: {highest_quantity}")
```

4.2.3. City that Sold the Most Products

01:45 and performs the following

operations:

- The CSV file contains the columns: Date, Product, Quantity, Price, and City.
- Group the data by City and calculate the total quantity of products sold for each city.
- Find the city that sold the most products (based on the total quantity sold).

Sample Data:

Date,Product,Quantity,Price,City

2025-01-01,Product A,5,20,New York

2025-01-01,Product B,3,15,Los Angeles

2025-01-02,Product A,7,20,New York

Write a Python program that takes the file name of a CSV file as input, reads the data,

```
2025-01-02,Product C,4,30,Chicago
2025-01-03,Product B,2,15,Chicago
2025-01-03,Product A,8,20,Los Angeles
2025-01-04,Product C,6,30,New York
2025-01-04,Product B,5,15,Los Angeles
2025-01-05,Product A,3,20,Chicago 2025-01-
05,Product C,10,30,Los Angeles
```

Note:

The data cannot be displayed in the file. You can refer to the sample data provided for insights.

```
import pandas as pd
```

```
# Prompt the user for the file name
```

```
file_name = input()
```

```
# Load the data df = pd.read_csv(file_name) #
```

```
Group by City and calculate total quantity
```

```
city_sales = df.groupby('City')['Quantity'].sum()
```

```
# Find the city with the highest total quantity sold
```

```
best_city = city_sales.idxmax()
```

```
# Display the result print(f"City sold the most
```

```
products: {best_city}")
```

4.2.4. Most Frequently Sold Product Pairs

01:25

and performs the following operations:

- The CSV file contains the following columns: Date, Product, Quantity, Price, and City.
- For each date, find all pairs of products that were sold together (i.e., two products sold on the same date).
- Output the product pair/s that was sold most frequently.

Sample Data:

Date,Product,Quantity,Price,City

2025-01-01,Product A,5,20,New York

2025-01-01,Product B,3,15,Los Angeles

2025-01-02,Product A,7,20,New York

2025-01-02,Product C,4,30,Chicago

2025-01-03,Product B,2,15,Chicago

2025-01-03,Product A,8,20,Los Angeles

2025-01-04,Product C,6,30,New York

2025-01-04,Product B,5,15,Los Angeles

Write a Python program that takes the file name of a CSV file as input, reads the data,

2025-01-05,Product A,3,20,Chicago 2025-01-

05,Product C,10,30,Los Angeles

Explanation:

Transactions:

- 2025-01-01: Product A, Product B
- 2025-01-02: Product A, Product C
- 2025-01-03: Product B, Product A
- 2025-01-04: Product C, Product B · 2025-01-05: Product A, Product C

Now, let's count how often the pairs of products appear together:

- Product A and Product B : Appear in transactions on 2025-01-01 and 2025-01-03.
- Product A and Product C : Appear in transactions on 2025-01-02 and 2025-01-05.
- Product B and Product C : Appears in transactions on 2025-01-04.

Most Frequent Product Combinations:

- Product A and Product B (2 times)
- Product A and Product C (2 times)

Note:

The data cannot be displayed in the file. You can refer to the sample data provided for insights.

```
import pandas as pd
```

```
from itertools import combinations
from collections import Counter

# Prompt user to input the file name
file_name = input()

# Read data from the specified CSV file
df = pd.read_csv(file_name) # write the
code pair_counter = Counter()

# Group by Date and generate product pairs
for _, group in df.groupby('Date'):
    products = group['Product'].tolist()    pairs =
    combinations(sorted(products), 2)
    pair_counter.update(pairs)

# Find maximum frequency max_count
= max(pair_counter.values())

# Output the most frequent product pairs
for pair, count in pair_counter.items():
    if count == max_count:

        print(f'{pair[0]} and {pair[1]}: {count} times')
```

4.2.5. Titanic Dataset Analysis and Data Cleaning

01:36

You are provided with the Titanic dataset containing information about passengers on the Titanic. Your task is to write Python code to answer the following questions based on the dataset. For each question, perform necessary data cleaning, transformations, and calculations as required.

1. Display the first 5 rows of the dataset.
2. Display the last 5 rows of the dataset.
3. Get the shape of the dataset (number of rows and columns).
4. Get a summary of the dataset (using `.info()`).
5. Get basic statistics (mean, standard deviation, etc.) of the dataset using `.describe()`.
6. Check for missing values and display the count of missing values for each column.
7. Fill missing values in the 'Age' column with the median age.
8. Fill missing values in the 'Embarked' column with the most frequent value (`mode()`).
9. Drop the 'Cabin' column due to many missing values.
10. Create a new column, 'FamilySize' by adding the 'SibSp' and 'Parch' columns.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Data:

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked
1	0	3	"Braund, Mr. Owen Harris"	male	22	1	0	A/5 21171	7.25		S
2	1	1	"Cumings, Mrs. John Bradley (Florence Briggs Thayer)"	female	38	1	0	PC 17599	71.2833	C85	C
3	1	3	"Heikkinen, Miss. Laina"	female	26	0	0	STON/O2. 3101282	7.925		S
4	1	1	"Futrelle, Mrs. Jacques Heath (Lily May Peel)"	female	35	1	0	113803	53.1	C123	S
5	0	3	"Allen, Mr. William Henry"	male	35	0	0	373450	8.05		S
6	0	3	"Moran, Mr. James"	male		0	0	330877	8.4583		Q
7	0	1	"McCarthy, Mr. Timothy J"	male	54	0	0	17463	51.8625	E46	S
8	0	3	"Palsson, Master. Gosta Leonard"	male	2	3	1	349909	21.075		S
9	1	3	"Johnson, Mrs. Oscar W (Elisabeth Vilhelmina Berg)"	female	27	0	2	347742	11.1333		S
10	1	2	"Nasser, Mrs. Nicholas (Adele Achem)"	female	14	1	0	237736	30.0708		C

Note: Refer to the visible test case for better reference.

```
import pandas as pd
```

```
import numpy as np
```

```
# Load the Titanic dataset data =
```

```
pd.read_csv('Titanic-Dataset.csv') # 1.
```

```
Display the first 5 rows of the dataset
```

```
print(data.head())
```

```
# 2. Display the last 5 rows of the dataset
```

```
print(data.tail())
```

```
# 3. Get the shape of the dataset
```

```
print(data.shape)
```

```
# 4. Get a summary of the dataset (info)
```

```
print(data.info())
```

```
# 5. Get basic statistics of the dataset
```

```
print(data.describe())
```

```
# 6. Check for missing values
```

```
print(data.isnull().sum())
```

```
# 7. Fill missing values in the 'Age' column with the median age
```

```
data['Age'] = data['Age'].fillna(data['Age'].median())
```

8. Fill missing values in the 'Embarked' column with the mode

```
data['Embarked'] = data['Embarked'].fillna(data['Embarked'].mode()[0])
```

9. Drop the 'Cabin' column due to many missing values

```
data = data.drop(columns=['Cabin'])
```

10. Create a new column 'FamilySize' by adding 'SibSp' and 'Parch'

```
data['FamilySize'] = data['SibSp'] + data['Parch']
```

The screenshot shows a Jupyter Notebook interface with a test case summary at the top and a detailed comparison of expected vs actual output below.

Test Case Summary:

- Average time: 0.166 s
- Maximum time: 0.166 s
- 1 out of 1 shown test case(s) passed

Test case 1 (166 ms):

Expected output:

PassengerId	Survived	Pclass	Fare	Cabin	Embarked
0	1	0	7.2500	NaN	S
1	2	1	71.2833	C85	C
2	3	1	7.9250	NaN	S
3	4	1	53.1000	C123	S
4	5	0	8.0500	NaN	S

[5 rows x 12 columns]

Actual output:

PassengerId	Survived	Pclass	Fare	Cabin	Embarked
0	1	0	7.2500	NaN	S
1	2	1	71.2833	C85	C
2	3	1	7.9250	NaN	S
3	4	1	53.1000	C123	S
4	5	0	8.0500	NaN	S

[5 rows x 12 columns]

The comparison shows that the expected and actual outputs are identical for the first 5 rows. The second comparison shows rows 886 to 890, also with identical expected and actual outputs.

4.2.6. Titanic Dataset Analysis and Data Cleaning - 2

02:18

You are provided with the Titanic dataset containing information about passengers on the Titanic. Your task is to write Python code to answer the following questions based on the dataset.

1. Create a new column 'IsAlone' which is 1 if the passenger is alone (FamilySize = 0), otherwise 0.
2. Convert the 'Sex' column to numeric values (male: 0, female: 1).
3. One-hot encode the 'Embarked' column, dropping the first category.
4. Get the mean age of passengers.
5. Get the median fare of passengers.
6. Get the number of passengers by class.
7. Get the number of passengers by gender.
8. Get the number of passengers by survival status.
9. Calculate the survival rate of passengers.
10. Calculate the survival rate by gender.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Data:

PassengerId,Survived,Pclass,Name,Sex,Age,SibSp,Parch,Ticket,Fare,Cabin,Embarked

1,0,3,"Braund, Mr. Owen Harris",male,22,1,0,A/5 21171,7.25,,S

2,1,1,"Cumings, Mrs. John Bradley (Florence Briggs Thayer)",female,38,1,0,PC
17599,71.2833,C85,C

3,1,3,"Heikkinen, Miss. Laina",female,26,0,0,STON/O2. 3101282,7.925,,S
4,1,1,"Futrelle, Mrs. Jacques Heath (Lily May Peel)",female,35,1,0,113803,53.1,C123,S
5,0,3,"Allen, Mr. William Henry",male,35,0,0,373450,8.05,,S
6,0,3,"Moran, Mr. James",male,,0,0,330877,8.4583,,Q
7,0,1,"McCarthy, Mr. Timothy J",male,54,0,0,17463,51.8625,E46,S
8,0,3,"Palsson, Master. Gosta Leonard",male,2,3,1,349909,21.075,,S
9,1,3,"Johnson, Mrs. Oscar W (Elisabeth Vilhelmina Berg)",female,27,0,2,347742,11.1333,,S
10,1,2,"Nasser, Mrs. Nicholas (Adele Achem)",female,14,1,0,237736,30.0708,,C

Note: Refer to the visible test case for better reference.

```
import pandas as pd
import numpy as np

# Load the Titanic dataset data = pd.read_csv('Titanic-
Dataset.csv') data['FamilySize'] = data['SibSp'] +
data['Parch'] # 1. Create a new column 'IsAlone' (1 if
alone, 0 otherwise) data['IsAlone'] =
np.where(data['FamilySize'] == 0, 1, 0)

# 2. Convert 'Sex' to numeric (male: 0, female: 1)
data['Sex'] = data['Sex'].map({'male': 0, 'female': 1})

# 3. One-hot encode the 'Embarked' column data =
pd.get_dummies(data, columns=['Embarked'], drop_first=True)

# 4. Get the mean age of passengers
print(data['Age'].mean())

# 5. Get the median fare of passengers
print(data['Fare'].median())

# 6. Get the number of passengers by class
print(data['Pclass'].value_counts())

# 7. Get the number of passengers by gender
print(data['Sex'].value_counts())
```

8. Get the number of passengers by survival status

```
print(data['Survived'].value_counts())
```

9. Calculate the survival rate

```
print(data['Survived'].mean())
```

10. Calculate the survival rate by gender

```
print(data.groupby('Sex')['Survived'].mean())
```

The screenshot displays a Jupyter Notebook interface with a test case summary at the top. It indicates that the test case passed with an average time of 0.079 s and a maximum time of 0.079 s. Below this, a table compares the expected output with the actual output for a test case. The table has two columns: 'Expected output' and 'Actual output'. The data is organized into sections for different variables: 'Pclass' (int64), 'Sex' (int64), and 'Survived' (float64). Each section shows the expected and actual values for each category, along with the variable name and data type.

Expected output	Actual output
29.69911764705882	29.69911764705882

4.2.7. Titanic Dataset Analysis and Data Cleaning - 3

03:10

You are provided with the Titanic dataset containing information about passengers on the Titanic. Your task is to write Python code to answer the following questions based on the dataset.

1. Calculate the survival rate by class.

2. Calculate the survival rate by embarkation location (Embarked_S).
3. Calculate the survival rate by family size (FamilySize).
4. Calculate the survival rate by being alone (IsAlone).
5. Get the average fare by passenger class (Pclass).
6. Get the average age by passenger class (Pclass).
7. Get the average age by survival status (Survived).
8. Get the average fare by survival status (Survived).
9. Get the number of survivors by class (Pclass).
10. Get the number of non-survivors by class (Pclass).

The Titanic dataset contains columns as shown below,

Sample Data:

PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked

1,0,3,"Braund, Mr. Owen Harris",male,22,1,0,A/5 21171,7.25,,S

2,1,1,"Cumings, Mrs. John Bradley (Florence Briggs Thayer)",female,38,1,0,PC
17599,71.2833,C85,C

3,1,3,"Heikkinen, Miss. Laina",female,26,0,0,STON/O2. 3101282,7.925,,S

4,1,1,"Futrelle, Mrs. Jacques Heath (Lily May Peel)",female,35,1,0,113803,53.1,C123,S

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

5,0,3,"Allen, Mr. William Henry",male,35,0,0,373450,8.05,,S

6,0,3,"Moran, Mr. James",male,,0,0,330877,8.4583,,Q

7,0,1,"McCarthy, Mr. Timothy J",male,54,0,0,17463,51.8625,E46,S

8,0,3,"Palsson, Master. Gosta Leonard",male,2,3,1,349909,21.075,,S

9,1,3,"Johnson, Mrs. Oscar W (Elisabeth Vilhelmina

Berg)",female,27,0,2,347742,11.1333,,S

10,1,2,"Nasser, Mrs. Nicholas (Adele Achem)",female,14,1,0,237736,30.0708,,C

Note: Refer to the visible test case for better reference.

```
import pandas as pd
```

```
import numpy as np
```

```
# Load the Titanic dataset data = pd.read_csv('Titanic-Dataset.csv')
```

```
data['FamilySize'] = data['SibSp'] + data['Parch'] data['IsAlone'] =
```

```
np.where(data['FamilySize'] > 0, 0, 1) data = pd.get_dummies(data,
```

```
columns=['Embarked'], drop_first=True)
```

1. Calculate the survival rate by class

```
print(data.groupby('Pclass')['Survived'].mean())
```

2. Calculate the survival rate by embarked location

```
print(data.groupby('Embarked_S')['Survived'].mean())
```

3. Calculate the survival rate by family size

```
print(data.groupby('FamilySize')['Survived'].mean())
```

4. Calculate the survival rate by being alone

```
print(data.groupby('IsAlone')['Survived'].mean())
```

5. Get the average fare by class

```
print(data.groupby('Pclass')['Fare'].mean())
```

6. Get the average age by class

```
print(data.groupby('Pclass')['Age'].mean())
```

7. Get the average age by survival status

```
print(data.groupby('Survived')['Age'].mean()) # 8. Get the average fare by survival
```

```
status print(data.groupby('Survived')['Fare'].mean())
```

9. Get the number of survivors by class

```
print(data[data['Survived'] == 1]['Pclass'].value_counts())
```

10. Get the number of non-survivors by class

```
print(data[data['Survived'] == 0]['Pclass'].value_counts())
```
